Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

1. Problem Statement

You are a software developer tasked with building a module for a scientific calculator application. The primary function of this module is to convert infix mathematical expressions, which are easier for users to read and write, into postfix notation (also known as Reverse Polish Notation). Postfix notation is more straightforward for the application to evaluate because it removes the need for parentheses and operator precedence rules.

The scientific calculator needs to handle various mathematical expressions with different operators and ensure the conversion is correct. Your task is to implement this infix-to-postfix conversion algorithm using a stack-based approach.

Example

Input:

a+b

Output:

ab+

Explanation:

The postfix representation of (a+b) is ab+.

Input Format

The input is a string, representing the infix expression.

Output Format

The output displays the postfix representation of the given infix expression.

Refer to the sample output for formatting specifications.

Sample Test Case

```
Input: a+(b*e)
Output: abe*+
```

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

struct Stack {
    int top;
    unsigned capacity;
    char* array;
};

struct Stack* createStack(unsigned capacity) {
    struct Stack* stack = (struct Stack*)malloc(sizeof(struct Stack));

if (!stack)
```

```
return NULL;
                                                                                  24,80,1298
       stack->capacity = capacity;
       stack->array = (char*)malloc(stack->capacity * sizeof(char));
       return stack:
    }
    int isEmpty(struct Stack* stack) {
       return stack->top == -1;
    }
                                                                                   241801298
return stack->array[stack->top];
    char pop(struct Stack* stack) {
       if (!isEmpty(stack))
         return stack->array[stack->top--];
       return '$';
    }
    void push(struct Stack* stack, char op) {
       stack->array[++stack->top] = op;
                                                       241801298
return (ch >= 'a' && ch <= 'z') ||
(ch >= 'A' && ch
           (ch >= '0' && ch <= '9');
    }
    int Prec(char ch) {
       switch (ch) {
         case '+':
         case '-':
           return 1;
         case '*':
                                                                                   241801298
                                                       241801798
         case '/':
           return 2;
         case '^':
           return 3:
```

```
default:
            return -1;
    void infixToPostfix(char* exp) {
       struct Stack* stack = createStack(strlen(exp));
       if (!stack)
         return;
       int i, k = 0;
       char result[100];
       for (i = 0; exp[i]; i++) {
         char ch = exp[i];
         if (isOperand(ch)) {
           result[k++] = ch;
         else if (ch == '(') {
           push(stack, ch);
         else if (ch == ')') {
           while (!isEmpty(stack) && peek(stack) != '(')
              result[k++] = pop(stack);
           if (!isEmpty(stack) && peek(stack) == '(')
                                                        241801298
              pop(stack);
         else {
           while (!isEmpty(stack) &&
                ((Prec(ch) < Prec(peek(stack))) ||
                (Prec(ch) == Prec(peek(stack)) \&\& ch! = '^')) \&\&
                peek(stack) != '(') {
              result[k++] = pop(stack);
           push(stack, ch);
         }
       }
                                                        241801298
result[k++] = pop(stack);
```

24,180,1298

241801298

24,80,1298

```
result[k] = '\0';
printf("%s\n", result);

int main() {
    char exp[100];
    scanf("%s", exp);
    infixToPostfix(exp);
    return 0;
}

Status: Correct
